

2011 Mississippi Social Climate Survey of Tobacco Control

Although comprehensive tobacco control programs have moved toward logic models that incorporate political and social intermediate objectives such as smoke-free work sites, tobacco control planning and evaluation has been hampered by the lack of timely, comprehensive data about the attitudes and practices of U.S. adults. The Social Climate Survey of Tobacco Control (SCS-TC) was created to fill this void.

Purpose

The Social Climate Survey of Tobacco Control (SCS-TC) was developed as a methodology to objectively measure the fundamental position of tobacco control in society and thereby provide a data collection system to monitor program impacts. The survey includes items to measure progress toward intermediate objectives such as policy changes, changes in social norms, reductions in exposure of individuals to environmental tobacco smoke, and rejection of pro-tobacco influences.

Methods

Random Digit Dialing (RDD) methods have been the most efficient and cost-effective means for administering surveys to a representative sample of adults for several decades. However, data from the National Health Interview Survey highlight the growing problem of wireless substitution of landline telephones for survey researchers. Approximately 30% of the U.S. population lives in a household with only wireless telephone service.

The 2011 Mississippi Social Climate Survey of Tobacco Control reduces noncoverage bias due to wireless substitution by including two sampling frames, an RDD frame of households with a landline telephone and an address-based frame that includes all households that receive deliveries from the US Postal Service. Both sample frames represent the civilian, non-institutionalized adult population over age 18. The overall sample was weighted by race, gender, and age based on the most current U.S. Census estimates.
