The Mississippi Social Climate of Tobacco Control, 2000-2004

Robert Cameron McMillen Kathleen Gresham Cheryl Chambers Wolfgang Frese Arthur G. Cosby

ACKNOWLEDGMENT

The Mississippi Social Climate Survey of Tobacco Control was made possible through support provided by The Partnership for a Healthy Mississippi. The opinions expressed herein are those of the authors and do not necessarily reflect the views of The Partnership for a Healthy Mississippi.

The design of the survey instrument was based on an extensive review of extant instruments such as the Behavior Risk Factor Surveillance System, the Current Population Survey - Tobacco Supplement, and the California Adult Tobacco Survey, and supplemented by additional items needed to operationalize the social climate concept. The reliance on existing measurements was greatly enhanced by the review and excellent advice from the Office of Smoking and Health of the Centers for Disease Control and Prevention (CDC).

The origins of this study can be traced to research associated with the tobacco settlement in Mississippi. We developed the social climate approach to help the Mississippi Tobacco Control Foundation – The Partnership for a Healthy Mississippi and the Mississippi State Department of Health - monitor the degree to which their efforts were impacting the social fabric of Mississippi. Vivien Carver and Bonnie Reinert, at the Partnership for a Healthy Mississippi State Department of Health Jones and Sheila Keller, formerly of the Mississippi State Department of Health, worked closely with us in the development of a social climate survey.

The Mississippi Social Climate Survey of Tobacco Control, 2000 – 2004

In 1964, the U.S. Surgeon General formally announced the health risks of tobacco, thereby providing the impetus for one of the most intensive public health interventions in the history of the United States. Spanning several decades, the tobacco control movement has developed an increasingly effective series of social programs and policies designed to encourage nonsmoking and protect nonsmokers from environmental tobacco smoke. In the years following the initiation of the tobacco control movement, the percentage of current cigarette smokers in the American adult population has decreased dramatically from 42.4 percent in 1965 to 23.0 percent in 2002 (Centers for Disease Control and Prevention, 2004). This decrease translates into about 40 million fewer adult smokers in the United States today than had the rate remained at 42.4 percent. Tobacco control has recently witnessed two other major accomplishments. First, the tobacco companies have been hit with massive compensatory and punitive fines resulting from lawsuits by former smokers, as well as massive settlement expenses with individual states to cover health expenses related to tobacco use. Second, national and state agencies have implemented promising multicomponent programs to prevent and reduce youth tobacco use. These programs have become increasingly comprehensive through a shift from focusing primarily on individual tobacco use to more population-based interventions with broad objectives such as social, environmental, and political change (United States Department of Health and Human Services, 2000).

In somewhat simplified terms these national and statewide programs target changes in the social climate. This approach is an attempt to denormalize tobacco use through changes in beliefs and knowledge that are incorporated into an individual's view of appropriate and acceptable behavior, to the rules and regulations that structure our organizations, and ultimately in the manner in which we see tobacco use as a part of the social environment (Stillman et al., 1999). Recent research validates this strategy to target intermediate social and political policies to impact the social climate, and ultimately reduce tobacco use. To illustrate, programs that have successfully reduced perceptions that tobacco use is a normative behavior and/or increased the prevalence of smoke-free policies in public and private settings have been linked to increased cessation attempts by smokers, lower consumption by smokers, and decreased initiation by adolescents (Borland, Chapman, Owen, & Hill, 1990; Farkas, Gilpin, Distefan, & Pierce, 1999; Farrelly, Evans, & Sfekas, 1999).

Although comprehensive tobacco control programs have moved toward logic models that incorporate political and social intermediate objectives, planning and evaluation in this area has been hampered by the lack of timely, comprehensive data about tobacco control attitudes and practices of US adults. We developed the Social Climate Survey of Tobacco Control (SCS-TC) as a methodology to objectively measure and ultimately monitor the fundamental position of tobacco control in society, and thereby provide a data collection system to monitor program impacts. The survey includes items to measure progress towards intermediate objectives such as policy changes, changes in social norms, reductions in exposure of individuals to environmental tobacco smoke, and rejection of pro-tobacco influences. The results presented in this report are based on annual cross-sectional assessments of the social climate of tobacco control within Mississippi and within the United States from 2000, 2001, 2002, 2003, and 2004.

Survey Development

The Social Climate Survey of Tobacco Control (SCS-TC) is an attempt to contribute to the understanding of tobacco control through the introduction of an institutional-based perspective that stresses not simply individual variations in behaviors and attitudes, but rather attempts to use cross-sectional survey data for the measurement of societal norms, practices, and beliefs surrounding tobacco. Put broadly, we want to measure the social norms, practices, and beliefs surrounding a public health issue - in this case tobacco use. This technique is primarily one of a shift in focus and interpretation rather than basic survey methodology. By asking this series of questions to a random sample of American adults, we can measure the extent to which tobacco control and tobacco use are ingrained in the social institutions that influence decisions about tobacco.

The concept of social institutions, taken from the sociological literature, provides the framework for our methodology. As a fundamental component of a society, social institutions emerge as clusterings of beliefs, norms, and practices in order to meet the needs of society. To illustrate, the institution of family and friendship groups provides the nurturing necessary to produce and raise new members of a society; the education institution then shapes the individual into a potentially productive member of society. Seven social institutions are included in our approach -- each of which meets specific needs of society. These institutions are: 1) Family and Friendship Groups, 2) Education, 3) Government and Political Order, 4) Work, 5) Health and Medical Care, 6) Recreation, Leisure, and Sports, and 7) Mass Communication and Culture. Moreover, in each of these institutional areas, beliefs, norms, and practices that form the essence of the ingrained status of tobacco use in the social fabric of American society. The Social Climate Survey consists of a set of questions designed to measure the norms, practices, and knowledge concerning tobacco within each of these institutions.

Until recently prevalence rates and per capita consumption measures have frequently been the yardsticks with which tobacco control programs were evaluated. While several state now have comprehensive data collection systems for planning and evaluation and there have been a substantial number of studies of attitudes toward the control of smoking in public settings (Ashley, Bull, & Pederson, 1995; Ashley & Cohen, 1998; Brooks & Mucci, 2001; Centers for Disease Control and Prevention, 2002c), no such descriptive studies published to date have been comprehensive or national in scope. To our knowledge, the present project is the most comprehensive survey of the extent to which tobacco control impacts the daily lives of Americans. The SCS-TC adds to existing national data sources by providing annual cross-sectional data on a comprehensive set of social and environmental indicators selected to monitor the fundamental position of tobacco control across a broad range of social settings. This emphasis on collecting data on the measurable characteristics of the social climate, as well the brief time lag - 5 months – between data collection and data availability, increases the utility of the SCS-TC as a data collection system for planning specific interventions and evaluation of program impacts on the social climate. Researchers at the Social Science Research Center have partnered with State agencies in Mississippi and the AAP's Center for Child Health Research to apply findings from the survey to planning and evaluation.

Methods

The Social Climate Survey of Tobacco Control (SCS-TC) was administered to representative samples of Mississippi adults who were interviewed by telephone between July and September of either 2000, 2001, 2002, 2003, and 2004. Samples from all years represent the civilian, non-institutionalized adult population over age 18. Households were selected using random digit dialing procedures to include households with unlisted numbers. Once a household was contacted, the adult to be interviewed was selected by asking to speak with the person in the household who is 18 years of age or older and who will have the next birthday. Five attempts were made to contact those selected adults who were not home. The sample was weighted by race and gender, based on the most current U.S. Census estimates.

Measures

The SCS-TC is an annual cross-sectional survey that contains items pertaining to normative beliefs, practices/policies, and knowledge regarding tobacco control across seven social institutions. These institutions include 1) Family and Friendship Groups, 2) Education, 3) Government and Political Order, 4) Work, 5) Health and Medical Care, 6) Recreation, Leisure, and Sports, and 7) Mass Communication and Culture. Although the SCS-TC includes items to measure smoking status and cessation, the survey emphasizes social and environmental indicators. These intermediate indicators were selected to provide a comprehensive assessment of the social climate in which people are exposed to and make decisions about tobacco control interventions. Survey items were developed and selected based on an extensive review of extant tobacco control surveys and then reviewed by an external panel of tobacco control researchers. The panel developed many of the items included in the survey, while others were selected from existing measurement instruments with established validity. Specifically, the SCS-TC included items from the Behavioral Risk Factor Surveillance System (BRFSS) (Centers for Disease Control and Prevention, 2002a) and the Tobacco Use Supplement- Current Population Survey (TUS-CPS) (Hartman, Willis, Lawrence, Marcus, & Gibson, 2002), as well as modified items from the California Adult Tobacco Surveys.

Results

To facilitate the interpretation and application of the survey results, we have developed the following heuristic classification scheme for assessing the social penetration of tobacco control in American society. Some issues are fully ingrained into society, such as norms against smoking in day care centers, and are thus considered to be universally accepted. Other issues are strongly supported, but continue to be rejected by a small, but nontrivial segment of society. These issues are considered as predominant cultural norms, beliefs, and practices. Contested issues, on the other hand, are areas of tobacco control in which there remain substantial differences of opinion across society. The support and opposition for these controls are roughly matched across society. Finally, some tobacco control issues, such as norms against smoking in bars, are supported by only a small segment of society and are considered to be culturally marginal norms, practices, or beliefs.

By identifying universal, predominant, contested, and marginal aspects of the social climate, it becomes possible to develop more informed tobacco control efforts. To illustrate, it may not be necessary to target culturally universal norms, practices, and beliefs because these aspects of tobacco control are already deeply ingrained. Norms, practices, and beliefs that are predominantly ingrained in the social climate may serve as anchors for campaign efforts to target contested aspects of the social climate. Finally, this approach can identify those aspects of the social climate which are only marginally ingrained and likely to be very resistant to interventions.

The following classification scheme is used to categorize the degree to which these aspects of tobacco control impact the daily lives of Americans.

the So	Heuristic Classification Scheme for Assessing the Social Penetration of Normative Beliefs, Health Beliefs, and Practices							
Universal	Universal normative beliefs, health beliefs, and practices Held by the overwhelming majority of society members: 85-100%							
Predominant	Predominant normative beliefs, health beliefs, and practices Held by a predominance of society members: 65-84%							
Contested	Contested normative beliefs, health beliefs, and practices Held by half of society members: 35-64%							
Marginal	Marginal normative beliefs, health beliefs, and practices Held by 0-34% of society members							

2000 MS Sample Characteristics

Of the eligible respondents contacted, 803 respondents completed the survey (85.0%) and 142 (15.0%) refused to participate. The sampling error (binomial questions with 50/50 split) for the total data set is no larger than \pm 3.5 (95% confidence interval). Of the 803 respondents, 292 (36.4 percent) were male and 511 (63.6 percent) were female. The racial composition of the sample is as follows: white = 577 (71.9 percent), African American = 196 (24.4 percent), Asian or Pacific Islander = 3 (.4 percent), American Indian or Alaskan Native = 1 (.1 percent), other races = 8 (1.0 percent), and unknown (i.e., did not answer the question on race) = 18 (2.2 percent). The sample was weighted by race and gender, based upon 1998 U.S. Census estimates to ensure that it is representative of the Mississippi population.

2001 MS Sample Characteristics

Of the eligible respondents contacted, 1,504 respondents completed the survey (87.6%) and 212 (12.4%) refused to participate. The sampling error (binomial questions with 50/50 split) for the total data set is no larger than ± 2.5 (95% confidence interval). Of the 1,504 respondents, 569 (37.8 percent) were male and 934 (62.1 percent) were female. The racial composition of the sample is as follows: white = 1,050 (69.8 percent), African American = 415 (27.6 percent), Asian or Pacific Islander = 6 (0.4 percent), American Indian or Alaskan Native = 2 (0.1 percent), other races = 12 (0.8 percent), and unknown (i.e., did not answer the question on race) = 19 (1.3 percent). The sample was weighted by race and gender, based upon 1999 U.S. Census estimates to ensure that it is representative of the Mississippi population. In the few cases where race and/or gender was missing the respondents were given a weight of 1.0.

2002 MS Sample Characteristics

Of the eligible respondents contacted, 1,013 respondents completed the survey (98.0%) and 21 (2.0%) refused to participate. The sampling error (binomial questions with 50/50 split) for the total data set is no larger than \pm 3.1 (95% confidence interval). Of the 1,013 respondents, 321 (31.7%) were male and 687 (67.8%) were female. The racial composition of the sample is as follows: white = 713 (70.4%), African American = 270 (26.7%), Asian or Pacific Islander = 5 (0.5%), American Indian or Alaskan Native = 1 (0.1%), other races = 14 (1.4%), and unknown (i.e., did not answer the question on race) = 10 (1.0%). The sample was weighted by race and gender, based upon 2000 U.S. Census estimates to ensure that it is representative of the Mississippi population.

2003 MS Sample Characteristics

Of the eligible respondents contacted, 815 respondents completed the survey (90.7%) and 33 (3.9%) did not complete the survey or refused to participate. The sampling error (binomial questions with 50/50 split) for the total data set is no larger than \pm 3.4 (95% confidence interval). Of the 815 respondents, 255 (31.3%) were male and 560 (68.7%) were female. The racial composition of the sample is as follows: white = 558 (68.5%), African American = 237 (29.1%), American Indian or Alaskan Native = 1 (.1%), other races = 7 (.9%), and unknown (i.e., did not answer the question on race) = 12 (1.5%). The sample was weighted by race and gender based upon 2002 U.S. Census estimates to ensure that it is representative of the Mississippi population.

2004 MS Sample Characteristics

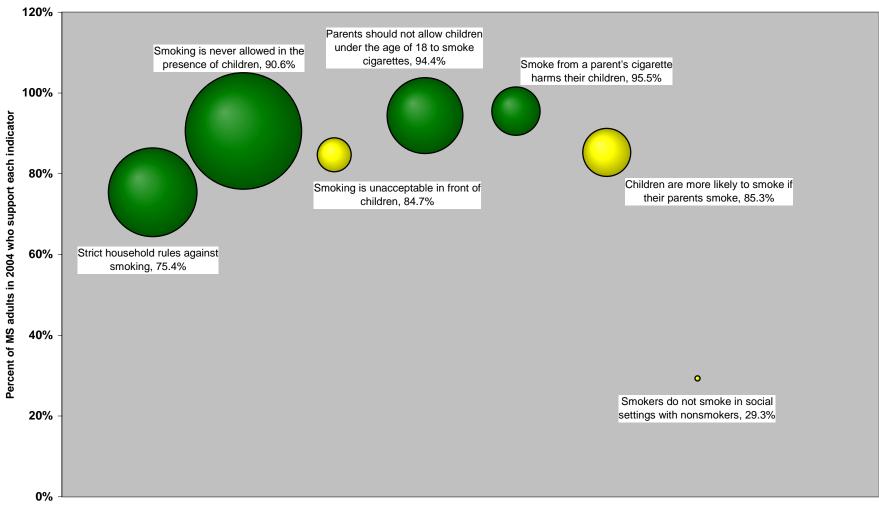

Of the eligible respondents contacted, 905 respondents completed the survey (96.1%) and 93 (9.3%) did not complete the survey or refused to participate. The sampling error (binomial questions with 50/50 split) for the total data set is no larger than ± 3.2 (95% confidence interval). Of the 905 respondents, 305 (33.7%) were male and 598 (66.1%) were female. The racial composition of the sample is as follows: white = 626 (69.2%), African American = 248 (27.4%), Asian or Pacific Islander = 4 (.4%), American Indian or Alaskan Native = 5 (.6%), other races = 8 (.9%), and unknown (i.e., did not answer the question on race) = 14 (1.5%). The sample was weighted by race and gender based upon 2002 U.S. Census estimates to ensure that it is representative of the Mississippi population.
